Abstract :- In this paper Industrial Steel truss Building of 14m x 31.50m, 20m x 50m,

28m x 70m and bay spacing of 5.25m, 6.25m and 7m respectively having column height of 6m is compared with Pre-engineering Buildings of same dimension. Design is based on IS 800-2007 (LSM) Load considered in modeling are Dead load, Live Load, Wind load along with the combinations as specified in IS. Analysis results are observed for column base as hinge base. Results of Industrial steel truss buildings are compared with the same dimensions of Pre-Engineering Building **Keywords: -** IS Code, Stadd Pro

I. INTRODUCTION

1.1 GENERAL

Any building structure used by industry to store raw materials or for manufacturing products of industry is known as an Industrial Building. These buildings are used for workshop, warehouse etc. Steel is extensively used in the construction of industrial building of larger spans where concrete construction is not feasible or when construction tome is critical. The important elements of industrial buildings are purlins, rafters, roof truss, wind bracing and columns. In India conventional steel constructions are most popular because of their ease in construction, low cost, availability of manpower for erection & fabrication and availability of standard specifications 7 codes of practice. For industrial building, the economy of the structure plays an important role. For longer spans the design is optimized in order to minimize the use of materials, costs, and installation efforts. Buildings are designed to reduce energy costs and to achieve a high degree of sustainability. To reduce the costs, manufacturer adopted the Pre-Engineering Building concept. Pre-engineering Buildings is a metal building that consist of light gauge metal standing seam roof an steel purlins spanning between rigid frames with light gauge metal wall cladding.

II. DESIGN OF TRUSSES

2.1 Mathematical model I - The mathematical model under consideration is shown in figure (2.1) for the truss having area of 14 m×31.50 m, having purling spacing of 1.489 m having bay spacing of 5.25 m and building height is 6m. The column base is taken as Pinned support.

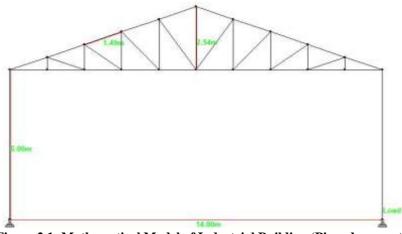

Figure 2.1: Mathematical Model of Industrial Building (Pinned support)

2.2 Loading Calculations

For the truss the dead load, live load, and wind load was considered. All of these were taken in accordance with is IS 875:1987

	Deud Iodd	
a)	Roofing material	- GI sheeting with unit weight of 150 N/m^2 .
b)	Purlins –	Assuming unit weight of purlin is 100 N/m^2 .
c)	Total dead load	$=150+100=250 \text{ N/m}^2 \text{ of plan area}$
		$= 0.250 \text{ kN/m}^2$ of plan area
Dead	load on plan area	= load x spacing of purlin in plan x bay spacing
		$= 0.25 \text{ x} 1.489 \times \cos(20) \times 5.25$
		= 1.84 kN at each node
		= 1.84/2 at end node
		= 0.92 kN
••	Time load (Agmon I	

ii. Live load (As per IS 875:1987 part II)

As per IS 875:1987 part II when slope is greater than $\ge 10^{\circ}$ then imposed load on purlin is 750 N/m² less 20 N/m² for every degree increase in slope in excess of 10[°] but not less than 400 N/m².

Live load =750 - 20× (20-10) =550 N/m² In case of cloping roofs with cloping greater than 10^0 m

In case of sloping roofs with sloping greater than 10^{0} , members supporting the roof purlins, such as trusses, beams, girders, etc. may be designed for two – thirds of the imposed load on purlins or roofing sheeting. $2/3^{rd}$ load = $2/3 \times 550$

 $= 366.67 \text{ N/m}^2$

i.

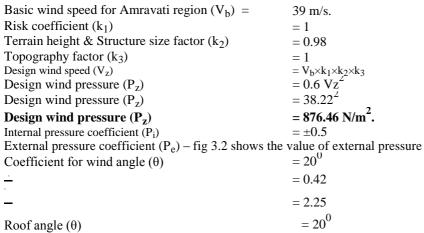

Dead load

Live load on plan area = load x spacing of purlin in plan x bay spacing = $366.67 \times 1.489 \times \cos(20) \times 5.25$

= 2.70 kN at each node

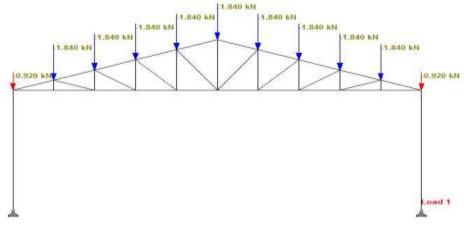

= 2.70/2 at end node

2.2.3 Wind load (As per IS 875:1987 part III)

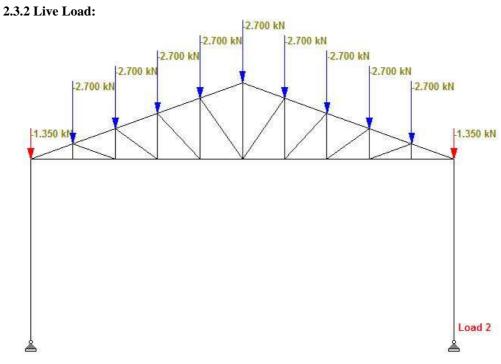

2.3 Loading diagram:

2.3.1. Dead Load:

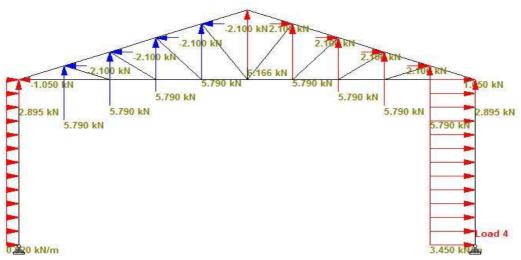

```
2.3.3 Wind Load:
```

2.4 Design of Purlin (ISMC):

201 Debigin		
Span 5.25 n	n.	
Spacing of purlin		= 1.489 m.
Dead load on plan area		$= 0.25 \times 1.40 = 0.35$ kN/m.
Live load on plan area		$= 0.55 \times 1.40 = 0.77 \text{ kN/m}.$
Wind load a	acting on roof area	= -0.9×0.876×1.489
	-	= -1.174 kN/m
2.4.1	Loads normal to slope	2
	Dead load Wdz	$= 0.35 \times \cos(20) = 0.33 \text{ kN/m}.$
	Live load Wlz	$= 0.77 \times \cos(20) = 0.723 \text{ kN/m}.$
	DL + LL	= 0.33 + 0.723 $= 1.053 $ kN/m.
2.4.2	Loads parallel to slop	e
	Dead load W _{dy}	$= 0.35 \text{ x} \sin(20) = 0.12 \text{ kN/m}.$
	Live load W _{ly}	$= 0.77 \text{ x} \sin(20) = 0.26 \text{ kN/m}.$

2.4.3 Factored load combination (Z direction) WL + DL + LL = (1.2 x -1.173) + (1.2 x 0.33) + (1.2 x 0.33) = - 0.144 kN/m.DL + LL = (1.5 x 0.33) + (1.5 x 0.723) = -1.5795 kN/mWL + DL = (1.2 x -1.173) + (1.2 x 0.33) = - 1.0116 kN/m.

(Y direction)

 $DL + LL = (1.5 \times 0.12) + (1.5 \times 0.26)$ = 0.57 kN/m.

2.4.4 Bending moment and shear force calculations $M_z = 1.5795 \times 5.25^2/8 = 5.503$ kN-m Since sag rod is introduced at 1/3rd of span so Y-Direction moment will be very less $= 0.57 \text{ x } 5.25^2/90$ M_v = 0.17 kN-m= 1.5795 x 5.25/2 = 4.146 kN. Fz = 0.57 x 5.25/2 = 1.496 kN.Fv **TRY ISMC 125** Section classification $\begin{array}{ll} \text{d/t}_w &= 125\text{-}\ 2(8.1+9.5)/5.0 \\ &= 17.6 < 42 \end{array}$ i. ii. $b/t_f = 65/8.1$ = 8.02 < 9.4 (section is plastic)

Check for shear calculations: Z direction

 $V_{d} = \frac{1}{2} x h x t_{w} = \frac{1}{2} x 125 x 5.0$ = 82.009 kN. 0.6V_{d} = 49.205 > 4.146 kN. Ok. **Y direction** Shear capacity = $\frac{1}{2} x x 2 x 65 x 8.1/10^{3}$ = 13.69 > 1.496 kN. Ok.

Design capacity of the section

$$\begin{split} M_{dz} &= \underbrace{\qquad}_{=} = \underbrace{\qquad}_{=} = \underbrace{\qquad}_{=} = \underbrace{\qquad}_{=} = 17.25 \text{ KN-m} \leq 1.2 \text{ x Zez x fy } / \gamma_{mo} \\ &\leq 18.16 \text{ kN-m ok} \\ M_{dy} &= \underbrace{\qquad}_{=} = 14.93 \text{ x} 10^3 \text{ x } 250 / 1.1 \text{ x} 10^6 \\ &= 3.39 \text{ KN-m.} \leq \gamma_f \text{ x Zey x fy } / \gamma_{mo} \\ &\leq 1.5 \text{ x } 13.1 \text{ x } 10^3 \text{ x } 250 / 1.1 \text{ x } 10^6 \leq 4.46 \text{ kN-m} \\ &= 14.93 \text{ x} 10^3 \text{ x } 250 / 1.1 \text{ x } 10^6 \leq 4.46 \text{ kN-m} \\ &= 1.5 \text{ x } 13.1 \text{ x } 10^3 \text{ x } 250 / 1.1 \text{ x } 10^6 \leq 4.46 \text{ kN-m} \\ &= 1.0 \end{split}$$

0.368 <1.0 **ok.**

Hence overall member strength is satisfactory Check for deflection $\delta = -$

= 8.58 mm.

= 29.16 mm. Ok.

Check for wind suction Factored wind load $W_z = 0.9 \text{ DL} -1.5 \text{ WL}$ = 0.9×0.33 -1.51.173 = -1.4445 kN/m.

 $W_y = -0.9 \times 1.173 \text{ x sin}$ (20) = -0.36 kN/m. Buckling resistance of the section Equivalent length = 5.25m. Moment $M_z = wl^2/8$ $= 1.4445 \times 5.25^{2}/8$ = 4.976 kN-mM_y = wl²/90 = 0.11 kN-m. $M_{cr} = \frac{12}{2}$ *(+ G = $= 76.923 \text{ x}10^3$ $I_t = \sum_{t=1}^{t}$ $= \left[\underline{^{2*65*81^3}}_{,} + \underline{^{125-8.1*5^3}}_{,} \right]$ $= 27899.94 \text{ mm}^4$ $= (1 - Bf) \times Bf \times Iy \times hf^2$ \mathbf{I}_{w} = 125-8.1 hf = 116.9 mm. = 0.5 B_{f} $= (1-0.5) \times 0.5 \times 59.9 \times 0^{4} \times 16.9^{2}$ $= 2.04 \times 10^{9} \text{ mm}^{6}.$ I_{W} * (76.923 * 10³ * 27899.9 + lad and Mcr = 9.91 kN-m ____β λ_{LT} = -= 1.0*75.92*10³*250 5.44 =1.38 $\phi 2_{LT} = 0.5 \times [1 + \alpha_{LT}^* (\lambda_{LT} - 0.2) + \lambda^2_{LT}]$ = 0.5 \times [1 + 0.21 \times (1.38 - 0.2 + 1.38^2] =1.576 ______ ≤ 1.0 χ_{LT} ≤ 1.0 = 0.427 < 1.0= ____ \mathbf{F}_{bd} = =97.04 N/mm² M_{dz} $= Z_p \times F_{bd}$ $=75.93 \times 10^3 \times 97.04$ = 7.36 kN-m > 4.976 kN-m.

The buckling resistance Mdy of the section need not be found out , because the purlins is restrained by cladding in the Z plane and hence instability is not considered for a moment about the minor axis. <u>Overall str</u>ength of the member $\frac{Overall strength}{Mm_{MM_{2}}^{stm}m_{2}^{sl0}}$

 $\frac{M_{42} + M_{49} \leq 1.0}{0.708 \leq 1.0} \le 1.0$

III. DESIGN OF PRE-ENGINEERING BUILDING

3.1 Introduction

In this section the design of various component of PEB has been considered. The component include:-

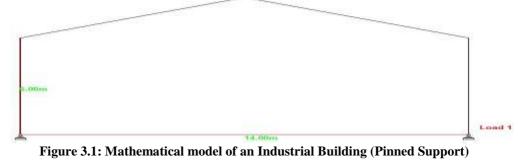

- i. Purlins
- ii. Girt Rods
- iii. Main frame
- iv. Bracings

The Purlins have been designed as per IS 801:1975 which deals with cold formed steel sections. The results of cold formed purlins are then compared with the results of channel purlins.

For the design of main frame, built up I sections have been used of which the web depth has been tapered section. The design of main frame has been done as per IS 800:2007(LSM)

Bracings are essentially made up of angle sections, pipe sections. The design of Bracing is done in 3-D model and the results are then computed.

3.2 Mathematical model I - The mathematical model under consideration is shown in figure (3.1) for the Preengineered building having area of 14 m x 31.50 m, purling spacing of 1.489 m and bay spacing of 5.25 m and building height is taken as 6m. The column base is taken as Pinned support.

3.3 Loading calculations

```
3.3.1 Dead load
```

d)Roofing material –GI sheeting with unit weight of 150 N/m^2 . e) Purlin – Assuming unit weight of purlin is 100 N/m². Total dead load = $150+100 = 250 \text{ N/m}^2$ of plan area = 0.250 kN/m^2 of plan area f) Dead load on plan area = load x bay spacing = 0.25 x 5.25 =1.3125 kN/m

3.3.2 Live load (As per IS 875:1987 part II)

As per IS 875 part II when slope is greater than $> 10^{0}$ then imposed load on purlin is 750 N/m² less 20 N/m^2 for every degree increase in slope in excess of 10⁰ but not less than 400 N/m^2 . Live load = 750 - 20 x (20-

 $10) = 550 \text{ N/m}^2$

In case of sloping roofs with sloping greater than 10^{0} , members supporting the roof purlins, such as trusses, beams, girders, etc. may be designed for two – thirds of the imposed load on purlins or roofing sheeting. $2/3^{rd}$ load = $2/3 \ge 550$

 $=366.67 \text{ N/m}^{2}$

 $= 0.366 \text{kN/m}^2$

Live load on plan area = load x bay spacing

= 0.366 x 5.25

= 1.9215kN/m

Wind load (As per IS 875:1987 part III) 3.3.3

Basic wind speed for Amravati region $(V_b) = 39$ m/s. Risk coefficient (k_1) = 1 Terrain height & Structure size factor $(k_2) = 0.98$

Topography factor (k₃) = 1 Design wind speed (Vz) $= V_b x k_1 x k_2 x k_3$

Design wind pressure (Pz) = 0.6 Vz^2

Design wind pressure (Pz) = 38.22^{2}

```
= 876.46 \text{ N/m}^2.
Design wind pressure (Pz)
```

Internal pressure coefficient $(P_i) = + -0.5$

External pressure coefficient (P_e) – fig 3.2 shows the value of external pressure coefficient for wind angle (0) $- = 0^{\circ}$

```
\leq 0.5
```

```
= 2.25
```

V. DISCUSSION

From comparison between figures design of purlins following results are computed

- 1. Weight of Channel Purlinis very high as compared to Truss Purlin and Z Purlin
- 2. Weight of Truss Purlin is very less as compared to Channel Purlin but weight of Truss Purlin is Slightly high as compared to Z Purlin

From the discussion stated above Weight of Z Purlin is slightly less compared to Truss Purlin. Thought the weight of Truss Purlin is slightly higher compared to Z Purlin, Truss Purlins are cost effective because cost per kg for Z Purlin is 80 to 90 Rs per Kg and Truss Purlins are 70 to 75Rs per Kg.

VI. CONCLUSION

In this Dissertation, Numerical study was carried out. The design of Various Component of Steel Truss building and Pre-Engineering Building (PEB) is done and the following conclusions are drawn:-

- i. From the design it is clear that using angle section for Truss and channel section for purlins, Steel Truss Building using pipe section and PEB is found to be economical compared to Steel Truss Building using angle section. The Percentage saving in results are stated below in table
- ii Also From comparison it is clear from the result that Weight of single Truss using Angle and Pipe both is less Compared to PEB but due to Weight of Channel Purlin, Weight of Steel Truss Building is on higher side.

	r 14m x 31.50m Pinned support	r 20m x 50m Pinned support	r 28m x 70m pinned support
saving in Weight for PEB	59%	37%	19%
saving in Weight for Steel Truss Building using Pipe section	47%	43%	98%

Table 5.1: Showing the	nercentage saving in	weight for PER
1 uoto 5.1. bilo wing the	percentage saving in	

Weight of Truss = 183.457 kNWeight of PEB = 116.315 kNDifference in weight = Weight of Truss - Weight of PEB = 67.142 kNPercentage saving in weight = $(67.142/183.45) \times 100$

= 36.59%

ii. From the design it is clear that using Pipe section in Truss and channel section for purlins, PEB is found to be economical compared to Steel Truss Building. The Percentage saving in results are stated below

From comparison it is clear from the result that Weight of single Truss is less Compared to PEB but due to Weight of Channel Purlin, Weight of Steel Truss Building is on higher side

Tuble 7.2. Blowing the percentage saving in weight for TED

	support	support		support
saving in eight for	93%	09%		46%
PEB				

Table 7.2: Showing the percentage saving in weight for PEB

iii. From the design it is clear that using Pipe section in truss and Truss purlin, Steel Truss Building is found to be economical compared to PEB. The results of saving in percentage are shown below

From Comparison it is clear that Weight of truss using Pipe section is less compared to PEB also Weight of Truss Purlin is not very high. So Weight of steel Truss Building is less as Compared to PEB

Table 7.3: Showing the percentage saving in weight for Steel Truss Building

	r 14m x 31.50m	r 20m x 50m Pinned	r 28m x 70m pinned
	Pinned support	support	support
% saving in	2%	9%	7%
Weight for Steel			
uss Building			

By using proper selection of material the Industrial Steel truss Building can be economical compared to PEB.
